This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We study processes underpinning spreading reduction in stable density-driven flows.
- We focus on the interactions between media heterogeneity and buoyancy effects.
- Velocity and pressure are decomposed in terms of stationary and dynamic contributes.
- Dynamic components accounts for the effects induced by density variability.
- We derive the equations for the ensemble of section-averaged concentrations.
