This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- a methodology to assess risk of water scarcity on irrigated agriculture is proposed
- hazard, exposure and vulnerability are assessed by combining multiple indicators
- different risk levels against climate change projections are estimated in Puglia
- outcomes can be used to promote optimal knowledge-based adaptation strategies
