Mean circulation of the Mid-Atlantic Bight from a climatological data assimilative model

Julia Levin , John Wilkin , Naomi Fleming , Javier Zavala-Garay

PII: S1463-5003(18)30177-X
DOI: [10.1016/j.ocemod.2018.05.003](https://doi.org/10.1016/j.ocemod.2018.05.003)
Reference: OCEMOD 1309

To appear in: *Ocean Modelling*

Received date: 19 December 2017
Revised date: 10 April 2018
Accepted date: 15 May 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Data assimilation gives 3-D mean coastal ocean circulation in dynamic and kinematic balance that matches climatology.
- Mean Dynamic Topography, with coastal altimeter sea level anomaly, gives total water level above datum.
- Mid-Atlantic Bight along-shelf sea level slope is uniform inside the 50-m isobath with magnitude $\sim 0.5 \times 10^{-7}$.
- Across-shelf circulation locally conserves volume in the north, but exports outer shelf water in the south.
