**15 Abstract**

16 Cocoa powder is a highly valuable global product that can be adulterated with low-cost

17 raw materials like carob flour as small amounts of this flour would not change the color,

18 aroma and taste characteristics of the final product. Rapid methods, like NIR technology

19 combined with multivariate analysis, are interesting for such detection. In this work,

20 unaltered cocoa powders with different alkalization levels, carob flours with three

21 different roasting degrees, and adulterated samples, prepared by blending cocoa

22 powders with carob flour at several proportions, were analyzed. The diffuse reflectance

23 spectra of the samples of 1100 - 2500 nm were acquired in a Foss NIR

24 spectrophotometer. A qualitative and a quantitative analysis were done. For the

25 qualitative analysis, a principal component analysis (PCA) and a partial least squares

26 discriminant analysis (PLS-DA) were performed. Good results (100% classification
