10 **Abstract**

11 The research deals with development of a new methodology for preconcentration and
12 determination of vanillin in food products using vortex-assisted ionic liquid-dispersive
13 microextraction (VAILDME) followed by ultraviolet-visible (UV-vis) spectrophotometry. The
14 hydrophobic vanillin complex was extracted directly from the foods into the fine droplets of
15 ionic liquid (IL) in presence of Cu(II) at pH 8.0. By the experimental studies, the optimum
16 conditions were determined as follows; pH 8.0, 0.5 mmol L⁻¹ of Cu(II) solution, 250 µL of the
17 IL, 100 µL of ethanol, 5 min of vortexing time. Under the optimal conditions, the method
18 showed good linearity in the range of 0.5-300 µg L⁻¹ with a limit of detection 0.15 µg L⁻¹. The
19 reliability of the method was evaluated in terms of repeatability (as RSD%, n: 10) and
20 reproducibility (as RSD%, n: 3×5) after spiking with 10, 50 and 100 µg L⁻¹, and the precision
21 levels were 3.7% and 4.1%, respectively. The accuracy of the method was assessed by
22 recovery experiments, and the recoveries for spiked samples were quantitative in range of
23 92.1-103.0%. After validation studies, the method was successfully applied to the
24 determination of vanillin in food products with satisfactory results.
