Abstract

In this paper, we consider the Cauchy problem for a family of nonlocal complex Ginzburg-Landau equation

$$e^{-i\theta}u_t = \Delta u + \left(\frac{1}{|x|^{n-\alpha}} * |u|^p \right) |u|^{p-2}u - \lambda u$$

on \mathbb{R}^n , where $-\pi/2 < \theta < \pi/2$ and $\lambda \in \mathbb{R}$. First, the local well-posedness in Lebesgue spaces is established by a fixed point argument. Then we set up the H^2 regularity and derive the energy identities. By constructing some invariant sets, we further find some sufficient conditions on finite time blow-up and global existence for solutions which in particular determines a sharp threshold of initial data when $\lambda > 0$. In addition, we estimate the lifespan of solutions as a function of θ and obtain the lower bound of the maximal existence time for $\lambda \in \mathbb{R}$.

Keywords:

nonlocal complex Ginzburg-Landau equation, global existence, finite time blow-up, blow-up time
