Abstract

We consider differential systems in \mathbb{R}^N driven by a nonlinear nonhomogeneous second order differential operator, a maximal monotone term and a multivalued perturbation $F(t, u, u')$. For periodic systems we prove the existence of extremal trajectories, that is solutions of the system in which $F(t, u, u')$ is replaced by $\text{ext}F(t, u, u')$ (= the extreme points of $F(t, u, u')$). For Dirichlet systems we show that the extremal trajectories approximate the solutions of the “convex” problem in the $C^1(T, \mathbb{R}^N)$ -norm (strong relaxation).

Keywords: Maximal monotone map, differential inclusion, extremal trajectories, strong relaxation, bang-bang controls

1. Introduction

The starting point of our work in this paper is the following periodic system

$$\begin{cases} a(u'(t))' \in A(u(t)) + F(t, u(t), u'(t)) & \text{for a.a. } t \in T = [0, b], \\ u(0) = u(b), \quad u'(0) = u'(b). \end{cases} \quad (1)$$
