## Abstract

We show that, if a rational homology 3-sphere  $Y$  bounds a positive definite smooth 4-manifold, then there are finitely many negative definite lattices, up to the stable-equivalence, which can be realized as the intersection form of a smooth 4-manifold bounded by  $Y$ . To this end, we make use of constraints on definite forms bounded by  $Y$  induced from Donaldson's diagonalization theorem, and correction term invariants due to Frøyshov, and Ozsváth and Szabó. In particular, we prove that all spherical 3-manifolds satisfy such finiteness property.

## 1. Introduction

Throughout this paper we assume that all manifolds are compact and oriented. We say a 4-manifold  $X$  is bounded by a 3-manifold  $Y$  if  $Y$  is
