Groundwater salinization and seawater intrusion tracing based on Lithium concentration in the shallow aquifer of Jerba Island, Southeastern Tunisia

Faiza Souid, Belgacem Agoubi, Faten Telahigue, Abdelkader Chahlaoui, Adel Kharroubi

PII: S1464-343X(17)30429-6
DOI: 10.1016/j.jafrearsci.2017.11.013
Reference: AES 3054
To appear in: *Journal of African Earth Sciences*
Received Date: 03 April 2017
Revised Date: 08 November 2017
Accepted Date: 10 November 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Seawater intrusion is the mechanism controlling the interaction between groundwater and aquifer materials.
- Lithium [content](#) and groundwater abnormal salinization are [highly correlated](#).
- Lithium is a tracer for the processes associated to seawater intrusion.
