This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The primary microbial distribution parts for HAVC systems were summarized.
- The corresponding predominant mold and bacteria species were identified.
- The mold growth partition diagram based on the limit growth curve was proposed.
- Factors affecting growth and deposition of microbial particles were determined.
- Effective and combined microbial control strategies for HVAC were presented.
