Abnormalities of fronto-subcortical pathways in schizophrenia and the differential impacts of antipsychotic treatment: a DTI-based tractography study

E. Leroux , A. Vandeveldel , M. Tréhout , S. Dollfus

PII: S0925-4927(18)30062-3
DOI: <https://doi.org/10.1016/j.psychresns.2018.08.008>
Reference: PSYN 10851

To appear in: *Psychiatry Research: Neuroimaging*

Received date: 26 February 2018
Revised date: 13 June 2018
Accepted date: 16 August 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The fronto-striato-thalamic network were studied in schizophrenia
- Structural connectivity was investigated through diffusion tensor imaging
- The differential impact of antipsychotics was tested on white matter tracts
- Patients exhibited lower integrity in the fronto-subcortical network
- Structural connectivity was differentially impacted by the type of antipsychotic treatment
