This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- For the first time, we formalize the problem of secure multi-label classification in cloud, and define the privacy and efficiency requirements in this problem.
- We propose a secure k-nearest neighbor based multi-label classification scheme, which can correctly complete multi-label classification and preserve the privacy of both data owner and consumers with practical efficiency.
- We formally prove the security of our scheme, which shows our proposed approaches can securely preserve the input instance and output classification results of each consumer, and guarantee the security of the data owner's training dataset and classification model.
- We analyze our computation complexity and communication overheads in detail, and leverage simulation experiments to evaluate the computation time of our proposed scheme.
