Detached eddy simulations of rising Taylor bubbles

H. Shaban, S. Tavoularis

PII: S0301-9322(18)30284-2
DOI: [10.1016/j.ijmultiphaseflow.2018.06.008](https://doi.org/10.1016/j.ijmultiphaseflow.2018.06.008)
Reference: IJMF 2836

To appear in: *International Journal of Multiphase Flow*

Received date: 13 April 2018
Revised date: 12 June 2018
Accepted date: 15 June 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

highlights

- Simulations of Taylor bubbles with turbulent wakes were performed using VOF and DES
- Void fraction, velocity and turbulence results were in agreement with experiments
- Temperature, pressure, and differential pressure fluctuations were also analysed
- Coherent structures in the far wake caused trailing bubble acceleration
- Recirculating vortex in the near wake accelerated trailing bubble coalescence
