This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

No author declared any conflict of interest in line with this work.

Clinical Implications: Basophil activation test has emerged as a powerful tool to predict clinical reactivity to allergens. However, as illustrated here for peanut allergy, caution should be care since basophil stimulation with global extract and molecular allergens may lead to opposite results.

Key words: Basophil activation test, CDsens, whole extract peanut, Ara h 2
