This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- Turbidity currents are responsible for carrying sediments leading to the formation oil reservoirs.
- Modeling offers new insights to geologists to understand the deposition mechanisms and the final reservoir form.
- We specifically study the model discrepancy induced by employing rheological laws describing the effective mixture viscosity.
- We propose a probabilistic formulation encompassing model discrepancy stochastic characterization, a hierarchical Bayesian formulation, and the corresponding numerical scheme to calibrate the model parameters.
- We analyze the efficacy of the proposed approach in a setup typically found in physical experiments.
